Basics

The set up you name and email address for all you Git repositories. You execute

```
$ git config --global user.name "Sifiso Motha"
$ git config --global user.email "sifiso@solms.co.za
```

These are saved in ~/.gitconfig. Top check if there have been set up correctory you run command

```
 git config user.name
```

To initialize a new Git repository will run

```
$ mkdir myFristProject
$ cd myFristProject
$ git init
```

Once the repository is initialized you add and commint file.

```
$ git add .
    $ git commit -m 'my first commit'
```

To clone a Git repository, what would call checkout on version control system such as Subvesion.

```
 git clone git@github.com:urdadmde/repo.git
```

For futher commands on Git you can contact the Git manualand other tutorials available on the net
